2008 Consumers Annual Report on Water Quality

People with Special Health Concerns

Some people may be more vulnerable to contaminants in drinking water than is the general population. Immuno-compromised persons such as persons with cancer undergoing chemotherapy, persons who have undergone organ transplants, people with HIV/AIDS or other immune system disorders, some elderly, and infants can be particularly at risk from infections. These people should seek advice about drinking water from their health care providers. EPA/CDC guidelines on appropriate means to lessen the risk of infection by *Cryptosporidium* and other microbial contaminants are available from the **Safe Drinking Water Hotline at (800-426-4791)**.

The City of Melvindale Water and Sewer Department wants you to know your tap water meets or surpasses all federal and state standards for quality and safety.

Our department is proud of the fine drinking water it provides and is honored to provide this report to you. This 2008 Consumers Annual Report on Water Quality shows the sources of our water, lists the results of tests, and contains important information about water and health. The Melvindale Water and Sewer Department will notify you immediately if there is ever any reason for concern about our water. We are pleased to show you how we have surpassed water quality standards as mandated by the Environmental Protection Agency (EPA) and the State of Michigan Department of the Environmental Quality (DEQ).

The Melvindale Water and Sewer Department is a member of the partnership for Safe Water, a new national initiative to help achieve operational excellence in water treatment. The partnership was developed through cooperation among the U. S. Environmental Protection Agency (EPA), states and water supply associations to provide better protection for consumers from microbial contaminants that can cause intestinal illness.

Drinking water, including bottled water, may reasonably be expected to contain at least small amounts of some contaminants. The presence of contaminants does not necessarily indicate that water poses a health risk. More information about contaminants and potential health effects can be obtained by calling the Environmental Protection Agency's "**Safe Drinking Water Hotline**" at **(800-426-4791)**.

The sources of drinking water (both tap water and bottled water) include rivers, streams, ponds, reservoirs, springs, and wells. As water travels over the surface of the land or through the ground, it dissolves naturally-occurring minerals and, in some cases, radioactive materials, and can pick up substances resulting from the presence of animals or human activity.

Contaminants that may be present in source water include:

1. Microbial contaminants, such as viruses and bacteria, which may come from sewage treatment plants, septic systems, agricultural livestock operations, and wildlife.
2. Inorganic contaminants, such as salts and metals, which can be naturally-occurring or result from urban storm water runoff, industrial or domestic wastewater discharges, oil and gas production, mining, or farming.
3. Pesticides and herbicides, which may come from a variety of sources such as agriculture, urban stormwater runoff and residential uses.
4. Organic chemical contaminants, including synthetic and volatile organics, which are by-products of industrial processes and petroleum production, and can also come from gas stations, urban stormwater runoff and septic systems.
5. Radioactive contaminants, which can be naturally occurring or be the result of oil and gas production and mining.

In order to ensure that tap water is safe to drink, EPA prescribes regulations, which limit the amount of certain contaminants in water provided by public water systems. The Food and Drug Administration (FDA) regulations establish limits for contaminants in bottled water, which must provide the same protection for public health.

Detroit River Intakes:

Your source water comes from the Detroit River, situated within the Lake St. Clair, Clinton River, Detroit River, Rouge River, Ecorse River, in the U.S. and parts of the Thames River, Little River, Turkey Creek and Sydenham watersheds in Canada. The Michigan Department of Environmental Quality in partnership with the U.S. Geological Survey, the Detroit Water and Sewerage Department, and the Michigan Public Health Institute performed a source water assessment in 2004 to determine the susceptibility of potential contamination. The susceptibility rating is on a seven-tiered scale from "very low" to "very high" based primarily on geologic sensitivity, water chemistry, and contaminant sources. The susceptibility of our Detroit River source water intakes were determined to be highly susceptible to potential contamination. However, all four Detroit water treatment plants that use source water from Detroit River have historically provided satisfactory treatment of this source water to meet drinking water standards. DWSD has initiated source-water protection activities that include chemical containment, spill response, and a mercury reduction program. DWSD participates in a National Pollutant Discharge Elimination System permit discharge program and has an emergency response management plan. If you would like to know more information about this report or a complete copy of this report please, contact your water department (313) 429-1064.

How Do We Know The Water Is Safe To Drink

We obtain water from the City of Detroit whose treatment facilities operate 24 hours a day, seven days a week. The treatment process begins with disinfecting the source water with chlorine to kill harmful microorganisms that can cause illness. Next, a chemical called Alum is mixed with the water to remove the fine particles that make the water cloudy or turbid. Alum causes the particles to clump together and settle to the bottom. Fluoride is also added to protect our teeth from cavities and decay.

The water then flows through fine sand filters called beds. These filters remove even more particles and certain microorganisms that are resistant to chlorine. Finally, a small amount of phosphoric acid and chlorine are added to the treated water just before it leaves the treatment plant. The phosphoric acid helps control the lead that may dissolve in water from household plumbing systems. The chlorine keeps the water disinfected as it travels through water mains to reach your home.

In addition to a carefully controlled and monitored treatment process, the water is tested for a variety of substances before treatment, during various stages of treatment, and throughout the distribution system. Hundreds of samples are tested each week in Detroit's certified laboratories by highly qualified, trained staff. Melvindale's water not only meets safety and health standards but also ranks among the top 10 in the country for quality and value.

Important Information About Lead

Since 1992, with the cooperation of many Melvindale residents, the Melvindale Water and Sewer Department has been testing homes with plumbing systems that may contribute lead to the household water supply. Our latest round of testing in 2008 shows none of the homes at the 90th percentile have lead levels above the action level. If your home has a lead service line or piping that has lead soldered joints you can take the following precautions to minimize your exposure to lead that may have leached into your drinking water from your pipes.

1. Run your water for 30 to 60 seconds or until it feels colder anytime your water has not been used for more than 6 hours.
2. Always use cold water for drinking, cooking, or making baby formula.
3. Use faucets and plumbing material that are either lead free or will not leach unsafe levels of lead into your water.

Infants and young children are typically more vulnerable to lead in drinking water than the general population. It is possible that lead levels at your home may be higher than at other homes in the community as a result of materials used in your homes plumbing. If you are concerned about elevated lead levels in your home's water, you may wish to have your water tested and flush your tap for 30 seconds to 2 minutes before using tap water. Additional information is available from the Safe Drinking Water Hotline (800-426-4791).

Health Effects: If present, elevated levels of lead can cause serious health problems, especially for pregnant women and young children. Lead in drinking water is primarily from materials and components associated with service lines and home plumbing. Melvindale Water department is responsible for providing high quality drinking water, but cannot control the variety of materials used in plumbing components. When your water has been sitting for several hours, you can minimize the potential for lead exposure by flushing your tap for 30 seconds to two minutes before using water for drinking or cooking. If you are concerned about lead in your water, you may wish to have your water tested. Information on lead in drinking water, testing methods, and steps you can take to minimize exposures available from the Safe Drinking Water Hotline or at <http://www.epa.gov/safewater/lead>.

Detected Contaminants Tables

These tables are based on tests conducted on our water by Detroit's Water and Sewer Department within the last five (5) calendar years. They conduct many tests throughout the year; however, only tests that show the presence of a contaminant are shown here. The table on the next page is a key to the terms used in the tables.

Symbol	Abbreviation For	Definition/Explanation
MCLG	Maximum Contaminant Level Goal	The level of contaminant in drinking water below which there is no known expected risk to health. MCLGs allow for a margin of safety.
MCL	Maximum Contaminant Level	The highest level of a contaminant that is allowed in drinking water. MCLs are set as close the MCLGs as feasible using the best available treatment technology.
MRDLG	Maximum Residual Disinfectant Level Goal	The level of a drinking water disinfectant below which there is no known or expected risk to health. MRDLGs do not reflect the benefits of the use of disinfectants to control microbial contaminants.
MRDL	Maximum Residual Disinfectant Level	The highest level of a disinfectant allowed in drinking water. There is convincing evidence that addition of a disinfectant is necessary for control of microbial contaminants.
ppm	Parts per million	The ppm is equivalent to milligram per liter. A milligram = 1/1000 gram.
NTU	Nephelometric Turbidity Units	Turbidity is a measure of the cloudiness of the water. We monitor it because it is a good indicator of the effectiveness of our filtration system. A guideline limit for turbidity is 1 NTU. For 5 NTU or above, a TT is required.
TT	Treatment Technique	A required process intended to reduce the level of a contaminant in drinking water.
AL	Action Level	The concentration of a contaminant, which, if exceeded, triggers treatment or other requirements which a water system must follow.
ppb	Parts per billion	The ppb is equivalent to microgram per liter. A microgram= 1/1000 gram.
%	Note 1	Unregulated contaminants are those for which EPA has not established drinking water standards. The purpose of unregulated contaminant monitoring is to assist EPA in determining the occurrence of unregulated contaminants in drinking water and whether future regulations is warranted. The THAA monitoring was conducted under Information Collection Rule (ICR) of 1996.
≥	More than or Equal to	
HAA5	Halo Acetic Acids	HAA5 is the total of bromoacetic, chloroacetic, dibromoacetic, dichloroacetic, and trichloroacetic acids. Compliance is based on the total.
TTHM	Total Trihalomethanes	Total Trihalomethanes is the sum of chloroform, bromodichloromethane, dibromochloromethane, and bromoform. Compliance is based on the total.

City of Melvindale Public Water System Regulated Contaminants Table

2008 Regulated Detected Contaminants Tables

Contaminant	Test Date	Units	Health Goal MCLG	Allowed Level MCL	Level Detected	Range of Detection	Violation yes/no	Major Sources in Drinking Water
Inorganic Chemicals – Annual Monitoring at Plant Finished Water Tap								
Fluoride	9/9/2008	ppm	4	4	1.05	n/a	no	Erosion of natural deposits; Water additive, which promotes strong teeth; Discharge from fertilizer and aluminum factories.
Nitrate	9/9/2008	ppm	10	10	0.26	n/a	no	Runoff from fertilizer use; Leaching from septic tanks, sewage; Erosion of natural deposits.
Barium	6/9/2008	ppm	2	2	0.01	n/a	no	Discharge of drilling wastes; Discharge from metal refineries; Erosion of natural deposits.
Disinfectant Residuals and Disinfection By-Products – Monitoring in Distribution System								
Total Trihalomethanes (TTHM)	Feb2007 Nov2008	ppb	n/a	80	24.6	6.2-43.4	no	By-product of drinking water chlorination.
Haloacetic Acids (HAA5)	Feb2007 Nov2008	ppb	n/a	60	12.9	4.9-23	no	By-product of drinking water disinfection.
Disinfectant (Total Chlorine Residual)	Jan-Dec 2008	ppm	MRDGL 4	MRDL 4	1.17	0.13-1.17	no	Water additive used to control microbes.

2008 Turbidity – Monitored every 4 hours at Plant Finished Water Tap			
Highest Single Measurement Cannot exceed 1 NTU	Lowest Monthly % of Samples Meeting Turbidity Limit of 0.3 NTU (minimum 95%)	Violation yes/no	Major Sources in Drinking Water
0.67 NTU	100%	no	Soil Runoff
Turbidity is a measure of the cloudiness of water. We monitor it because it is a good indicator of the effectiveness of our filtration system.			

2008 Microbiological Contaminants – Monthly Monitoring in Distribution System					
Contaminant	MCLG	MCL	Highest Number Detected	Violation yes/no	Major Sources in Drinking Water
Total Coliform bacteria	0	Presence of Coliform bacteria > 5% of monthly samples	in one month 2	Y	Naturally present in the environment.
E.coli or fecal coliform bacteria	0	A routine sample and a repeat sample are total coliform positive, and one is also fecal or E.coli positive.	entire year 0	N	Human waste and animal fecal waste.

Total residual Chlorine or Chloramines sampled in 2008 measured in Parts Per Million												
	Jan	Feb	Mar	Apr	May	Jun	Jul	Aug	Sep	Oct	Nov	Dec
Bacteriological Sample site 1	.76	.65	.75/.79	.75	.66/.70	.62/.52	.65	.78	.37	.41/.49	.13/.43	.42
Bacteriological Sample site 2	.80	.98	1.06	.96	.73		.71	.60/.87	.84	.80	.66	.83
Bacteriological Sample site 3	.68	.73/.71	.87	.56/.63	.87	.52/.65	.52	.66/.66	.5/.76	.38	.43	.55/.56
Bacteriological Sample site 5	1.17						.97					
Monthly Average (ppm)	0.85	0.76	0.87	0.72	0.74	0.61	0.71	0.71	0.62	0.52	0.41	0.59
Running annual average	0.85	0.80	0.83	0.80	0.79	0.76	0.75	0.74	0.73	0.71	0.68	0.67

City of Melvindale Residential Lead and Copper Testing

Contaminants	Test Date	Units	Number of Samples Collected	Number of Samples Exceeded AL	Action Level AL	90 th Percentile Value	Major Source in Drinking Water
Lead	2008	ppb	5	0	15ppb	2.5 ppb	Corrosion of household plumbing systems; Erosion of natural deposits.
Copper	2008	ppb	5	0	1300 ppb	57 ppb	Corrosion of household plumbing. Erosion of natural deposits. Leaching from wood preservatives.

2008 Special Monitoring

Contaminant	MCLG	MCL	Level Detected	Source of Contamination
Sodium (ppm)	n/a	n/a	4.8	Erosion of natural deposits

Unregulated contaminants are those for which EPA has not established drinking water Standards. Monitoring helps EPA to determine where certain contaminants occur and whether it needs to regulate those contaminants.

****TOC REMOVAL**

The Total Organic Carbon (TOC) removal ratio is calculated as the ratio between the actual TOC removal and the removal requirements. The TOC was measured each month and because the level was low, there is no requirement for TOC removal.

What, Exactly, is Cryptosporidium?

Cryptosporidium is a disease-causing parasite that lives in the intestinal tract of many animals including dogs and cats. Symptoms of infection include diarrhea, abdominal cramps, headaches, nausea and vomiting. The disease is typically spread through contact with feces of an infected animal or person and consuming contaminated food or water. Cryptosporidium can be introduced into bodies of water by way of surface water runoff containing animal waste and sewage discharge.

Cryptosporidium is a microbial pathogen found in surface water throughout the U.S. Although filtration removes Cryptosporidium, the most commonly used filtration methods cannot guarantee 100 percent removal. Our monitoring indicates the presence of these organisms in our source water. Cryptosporidium was detected once, during a twelve-month period at our Detroit River intake plants. Current test methods do not allow us to determine if the organisms are dead or if they are capable of causing disease. Ingestion of Cryptosporidium may cause cryptosporidiosis, an abdominal infection. Symptoms of infection include nausea, diarrhea, and abdominal cramps. Most healthy individuals can overcome the disease within a few weeks. However, immuno-compromised people, infants and small children, and the elderly are at greater risk of developing life-threatening illness. We encourage immuno-compromised individuals to consult their doctor regarding appropriate precautions to take to avoid infection. Cryptosporidium must be ingested to cause disease, and it may be spread through means other than drinking water.

About Detroit's System

The Detroit Water and Sewerage Department provides drinking water to approximately 4.2 million people in 126 southeastern Michigan communities. The system uses water drawn from two intakes in the Detroit River; one to the north near the mouth of Lake St. Clair and one to the south near Lake Erie. The water is directed to four (4) large water treatment plants for processing. A fifth water treatment plant located in St. Clair County uses surface water from Lake Huron. The four plants that treat water drawn from the Detroit River service customers in our area. Our water is obtained from either the Southwest or Springwells water treatment plants.

National Primary Drinking Water Regulation Compliance

In 2008 the City of Melvindale violated a drinking water standard. Our water system detected the presence of coliform bacteria in the water supply. We routinely monitor for the presence of drinking water contaminants. We took 11 samples for coliform bacteria during August 2008 and 2 of those samples showed the presence of coliform bacteria. The standard is that no more than **one** sample per month may do so. We were required to issue a public notice because a drinking water standard was violated. The contamination was limited to one service connection in our city at 19645 Outer Drive. **The problem with that location has been corrected and all subsequent testing indicated the water was, and continues to be, safe to drink.** We are continuing to monitor as required by the Michigan Department of Environmental Quality (MDEQ).

Other Monitoring

Unregulated contaminants are those for which EPA has not established drinking water standards. Monitoring helps EPA to determine where certain contaminants occur and whether it needs to regulate those contaminants. Beginning in July of 2008, the Detroit Water and Sewerage Department (DWSD) began monitoring quarterly for unregulated contaminants under the Unregulated Contaminant Monitoring Rule 2 (UCMR2.) All the UCMR2 contaminants monitored on List 1 and List 2 in 2008 were undetected.

In addition to testing that is required to be performed, our water supplier voluntarily tests for hundreds of additional substances and microscopic organisms to make certain our water is safe and of the highest quality. If you are interested in a more detailed report, contact **Eric Witte in the Water Department at (313) 429-1064.**

*We welcome your comments and opinions about this report and will be happy to answer any questions you may have. Please direct your comments or questions to **Eric Witte in the Water Department at (313) 429-1064.***
